DRAFT PHASE III CHESAPEAKE BAY TMDL ACTION PLAN

A Plan for Achieving an Additional 60% Pollutant Reduction (100% Cumulative) in Accordance with 9VAC25-890-40 Part II A

October 2023

This plan satisfies the requirements of Part I of the 2023 – 2028 MS4 General Permit (9VAC25-890-40) and Part II A of the 2023 – 2028 MS4 General Permit for Special Conditions for the Chesapeake Bay TMDL. This plan is consistent with the Chesapeake Bay TMDL and the Virginia Phase I, II, and III WIPs to meet the Level 2 (L2) scoping run for existing developed lands as it represents an implementation of 5.0%, 35% and 60% of L2.

EXECUTIVE SUMMARY

Northern Virginia Community College (NOVA) is authorized to discharge stormwater from its municipal separate storm sewer system (MS4) under the Virginia Pollutant Discharge Elimination System (VPDES) General Permit for Discharge of Stormwater from Small MS4s (MS4 General Permit). To maintain permit compliance, NOVA implements an MS4 Program Plan that includes best management practices (BMPs) to address six minimum control measures (MCMs) and special conditions for the Total Maximum Daily Load (TMDL) in which NOVA has been assigned a wasteload allocation (WLA). The Environmental Protection Agency (EPA) describes a TMDL as a "pollution diet" that identifies the maximum amount of a pollutant the waterway can receive and still meet water quality standards. A WLA determines the required reduction in pollutant of concern loadings from the MS4s to meet water quality standards. The MS4 General Permit serves as the regulatory mechanism for addressing the load reductions described in the TMDL, predominantly through the requirement of a TMDL Action Plan.

The Chesapeake Bay TMDL was established by the EPA on December 29, 2010, and initiated WLAs for phosphorus, nitrogen, and total suspended solids. In response, the Commonwealth of Virginia developed Watershed Implementation Plans (WIPs) that, in part, identify the MS4 General Permit as a mechanism for enforcing load reductions in urban areas. Subsequently, the Commonwealth included special conditions into the latest MS4 General Permit to address the reductions required by the TMDL for the pollutants of concern (POC). The WIPs intended the reductions to be achieved over the course of three 5-year permit cycles. The first cycle (2013 – 2018) required 5%, the second cycle (2018 – 2023) an additional 35%, and the third permit cycle (2023 – 2028) required an additional 60% of the reductions to be achieved, respectively.

NOVA developed Phase I, Phase II and Phase III Chesapeake Bay TMDL Action Plans consistent with the Virginia Department of Environmental Quality (DEQ) Guidance Memos No. 15-2005 and 20-2003. The guidance documents were used to determine the required pollutant load reductions for the previous and current permit cycles; and to evaluate the means and methods for achieving the reductions. Consistent with the DEQ Guidance documents, certain credits from historic water quality best management practices (BMPs) can be credited towards pollutant load reductions requirements. A review of NOVA's water quality BMPs identified applicable pollutant reduction credits from five stormwater management facilities, including three bioretention BMPs, a Filterra and a retention basin. The pollutant reductions available with these BMPs exceeded the required Phase I 5% reductions for the first permit cycle (2013 - 2018). NOVA implemented street sweeping and land use change conversions to achieve the Phase II 35% required reductions for the second permit cycle (2018 - 2023). This Phase III Action Plan will discuss the additional 60% required reductions for the third permit cycle (2023 - 2028).

These means and methods along with continued inspection and maintenance of the stormwater management facilities to ensure functionality; and continued implementation of the NOVA MS4 Program Plan are consistent with the provisions of an iterative MS4 Program and constitutes compliance with the MS4 General Permit standard of reducing pollutants to the maximum extent practicable.

Table 1: Summary of POC Load Reductions						
	Phase I	Phase II	Phase III	Cumulative		
POC	(2013 – 2018)	(2018 – 2023)	(2023 – 2028)	100% Load		
PUC	5% Load Reduction	35% Load Reduction	60% Load Reduction	Reduction		
	(lbs./yr.)	(lbs./yr.)	(lbs./yr.)	(lbs./yr.)

Definitions

Best Management Practices (BMPs) are schedules of activities, prohibitions of practices, maintenance procedures, and other management practices, including both structural and nonstructural practices, to prevent or reduce the pollution of surface waters and groundwater systems.

Census Urbanized Area (CUA) are areas identified as urban by the United States Census Bureau (latest census). MS4 regulations only apply within CUAs.

Existing Sources are pervious and impervious urban land uses served by the MS4 as of June 30, 2009.

Impervious Cover is a surface composed of material that significantly impedes or prevents natural infiltration of water into soil.

L2 Scoping Run is a model run to determine required reductions from urban sources as of June 30, 2009. The L2 reductions are summarized in the following table:

Pollutant of Concern	Regulated Impervious (%)	Regulated Pervious (%)
Nitrogen	9	6
Phosphorus	16	7.25
Sediment	20	8.75

Municipal Separate Storm Sewer System (MS4) is a conveyance or system of conveyances including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains that are:

- Owned or operated by a federal state, city, town, county, district, association, or other public body, created by or pursuant to state law that discharges to surface waters;
- Designed or used for collecting or conveying stormwater;
- Not a combined sewer; and
- Not part of a publicly owned treatment works.

New Sources are pervious and impervious urban land uses served by the MS4 developed or redeveloped on or after July 1, 2009.

NOVA MS4 Program Plan is the guiding document of the NOVA's MS4 Program and includes best management practices to address conditions of the MS4 General Permit.

Pollutants of Concern (POC) are total nitrogen ("TN"), total phosphorus ("TP"), and total suspended solids ("TSS").

Prior Developed Lands are lands that has been previously utilized for residential, commercial, industrial, institutional, recreation, transportation, or utility facilities or structures, and that will have the impervious areas associated with those uses altered during a land-disturbing activity.

Transitional Sources are regulated land disturbing activities that are temporary in nature and discharge through the MS4.

1.0 INTRODUCTION AND PURPOSE

Mandated by Congress under the Clean Water Act (CWA), the National Pollutant Discharge Elimination System (NPDES) storm water program includes the Municipal Separate Storm Sewer System (MS4), Construction, and Industrial General Permits. In Virginia the NPDES Program is administered by the Department of Environmental Quality (DEQ) through the Virginia Stormwater Management Program (VSMP) and the Virginia Pollutant Discharge Elimination System (VPDES). Northern Virginia Community College (NOVA) is authorized to discharge stormwater from its MS4 under the VPDES General Permit for Discharge of Stormwater from Small MS4s (MS4 General

"NVCC's MS4 program strives to improve environmental compliance, quality and stewardship through effective management, implementation, and enforcement."

Permit). As part of the MS4 General Permit authorization, NOVA developed and implements a MS4 Program Plan with best management practices (BMPs) to address the six minimum control measures (MCMs) and the special conditions for applicable total maximum daily loads (TMDLs), as outlined in the MS4 General Permit. Implementation of these BMPs is consistent with the provisions of an iterative MS4 Program constituting compliance with the standard of reducing pollutants to the "maximum extent practicable" or MEP.

The NOVA MS4 program strives to achieve environmental compliance and good stewardship through effective management, implementation, and enforcement of sound technical guidelines, criteria and practices for stormwater management and erosion and sediment control. The plan presented herein demonstrates how NOVA's MS4 Program Plan addresses sediment and nutrients (nitrogen and phosphorus) in its MS4 regulated area consistent with the requirements of the Chesapeake Bay TMDL.

1.1 Total Maximum Daily Loads

A TMDL is the total amount of a given pollutant that a waterbody can assimilate and still meet water quality standards. Typically, TMDLs are represented numerically in three main components: Waste Load Allocations (WLAs), a Load Allocation (LA), and a Margin of Safety. A WLA is the allocated amount of pollutant from areas discharging through a pipe or other conveyance considered a point source. Point sources include sewage treatment plants, industrial facilities, and storm sewer systems. In contrast, an LA is the amount of pollutant from existing non-point sources and natural background sources such as agricultural runoff and atmospheric deposition. As a point source discharge, MS4's are assigned a WLA representing the annual loading of the pollutant of concern (POC) that can be discharged from its regulated MS4 area.

1.2 MS4 General Permit Special Conditions

NOVA's MS4 General Permit includes a series of special conditions that must be addressed for permit compliance where NOVA has been assigned a WLA as part of an approved TMDL. The special conditions state that any TMDL approved by the State Water Control Board (SWCB) assigning a WLA to an MS4 must be addressed by the Permittee through the measurable goals of their MS4 Program Plan.

In 1998, large portions of Chesapeake Bay and its tidal tributaries within Virginia were identified as not meeting water quality standards and listed as impaired because of excess nitrogen, phosphorus, and sediment. Due to the Chesapeake Bay waters remaining on the impaired waters list, the Environmental Protection Agency (EPA) required that a TMDL be developed, which was subsequently approved on December 29, 2010.

1.3 Watershed Implementation Plan and Strategy for MS4s

The Chesapeake Bay Watershed Implementation Plans (WIPs) are plans that detail how and when the six Chesapeake Bay states and the District of Columbia will meet pollutant allocations. In the Phase I and Phase II WIPs for the Chesapeake Bay TMDL, Virginia committed to a phased approach to reducing nutrients and suspended solids discharging from MS4s. The issuance of the 2013 - 2018 MS4 General Permit set forth special conditions required by all MS4 General Permit holders within the Chesapeake Bay watershed. In part, the special conditions require the permittee to achieve 5% of the required reductions identified in the Level 2 Scoping Run from existing baseline loads by July 1, 2018, 40% by July 1, 2023, and 100% by July 1, 2028. Baseline loads are defined as those occurring on June 20, 2009, and are computed using loading rates provided in the MS4 General Permit. The issuance of the Phase III 2023-2028 MS4 General Permit will remove the requirement for reducing suspended solids discharging from MS4s.

1.4 NOVA Chesapeake Bay Action Plan

The NOVA Action plan presented herein provides a review of the current MS4 program, which demonstrates NOVA's ability to ensure compliance with the special conditions and includes the means and methods NOVA used to meet 5.0% of the Level 2 (L2) scoping run reductions by July 1, 2018, and 40% reductions by July 1, 2023. This Plan also describes how NOVA anticipates meeting the 100% reductions by July 1, 2028.

This Action Plan was developed to comply with the special conditions of the MS4 General Permit (9VAC25-890) and under the advisement of DEQ's Guidance Memo No. 15-2005 and Guidance Memo No. 20-2003, which provides background information and procedures to meet the Chesapeake Bay TMDL special condition requirements.

2.0 APPLICABLE OVERVIEW OF NOVA'S MS4 PROGRAM

NOVA's MS4 Permit regulates stormwater discharges from areas included within census urbanized areas (CUAs). NOVA campuses included in CUAs include the Alexandria, Annandale, Loudoun, and Woodbridge campuses, as depicted in Appendix A. NOVA's collective efforts, as described in the NOVA MS4 Program Plan, result in significant reduction of pollutants that could potentially be discharged from its regulated MS4. BMPs already included in the NOVA Program Plan that address the Chesapeake Bay TMDL POCs, sediment and nutrients, are described in the following sub-sections. Each sub-section is provided to address the referenced special condition in the in the 2013 – 2018, 2018 – 2023, and 2023 – 2028 MS4 General Permits.

2.1 Current Program and Existing Legal Authority

As a non-traditional MS4, NOVA does not have the ability to create legal authorities and has not identified any legal authorities necessary to meet the requirements of the special conditions. However, NOVA's MS4 Program includes Minimum Control Measures (MCMs) that include policies and procedures consistent with the goals of the Chesapeake Bay TMDL.

- MCM 1 (Public Education and Outreach) NOVA's MS4 Program includes a Public Education and Outreach Program (PEOP) that identifies the Chesapeake Bay TMDL POCs as a high priority water quality issue. The PEOP is described in BMP 1.2 of the NOVA MS4 Program Plan and includes the distribution of educational materials regarding methods to reduce introduction of the POCs into stormwater runoff.
- MCM 3 (Illicit Discharge Detection and Elimination) NOVA's MS4 Program includes an Illicit Discharge Detection and Elimination (IDDE) Program that includes written procedures to detect, identify, and address non-stormwater discharges, including illegal dumping, to the small MS4 with policies and procedures for when and how to use legal authorities. NOVA prohibits non-stormwater discharges into the storm sewer system through language provided within the Standards of Conduct for employees and the Student Handbook for students. IDDE BMPs are described in the Minimum Control Measure 3 BMPs in the NOVA MS4 Program Plan. The IDDE Program is effective at addressing the POC through staff training, prohibition of illicit discharges, and annual outfall screening.
- MCM 4 (Construction Site Runoff Control) NOVA's MS4 Program includes a Construction Site Runoff Control Program that includes mechanisms to ensure compliance and enforcement on regulated construction sites with implementation of the DEQ-approved "VCCS Annual Erosion and Sediment Control and Stormwater Management Standards and Specifications." The standards and specifications are consistent with the Virginia Erosion and Sediment Control and Stormwater Management Laws and Regulations.

The Construction Site Runoff Control Program is especially effective at reducing downstream conveyance of sediment from transitional sources. Minimum Control Measure 4 BMPs in the NOVA MS4 Program Plan describe construction site runoff control BMPs.

- MCM 5 (Post-Construction Stormwater Management) NOVA's MS4 Program includes a Post-Construction SWM Program that ensures water quality criteria in the Virginia Stormwater Management Regulations has been achieved on new developments and developments on prior-developed land since July 1, 2009. Included among these requirements are written policies and procedures in the VCCS Erosion and Sediment Control and Stormwater Management Standards and Specifications to ensure that stormwater management facilities are designed and installed in accordance with appropriate law and regulations. Post-construction, the Program includes schedules and written procedures to ensure long-term inspections and maintenance of stormwater management BMPs. Minimum Control Measure 5 BMPs in the NOVA MS4 Program Plan describe postconstruction stormwater management BMPs.
- MCM 6 (Good Housekeeping) NOVA's MS4 Program includes a Pollution Prevention/Good Housekeeping Program that includes policies and procedures to ensure that day-to-day operations minimize the exposure of pollutants to rainfall on campus grounds to the maximum extent practicable. The program is supported with NOVA's Pollution Prevention & Good Housekeeping Manual and annual training for applicable staff. NOVA also utilizes contract language to ensure appropriate certifications for application of fertilizers per a Nutrient Management Plan approved by Virginia Department of Conservation and Recreation. Minimum Control Measure 6 BMPs in the NOVA MS4 Program Plan describe pollution prevention and good housekeeping BMPs.

2.2 New or Modified Legal Authorities

Consistent with the MS4 General Permit, NOVA uses an iterative approach to ensure the College is minimizing the discharge of pollutants through its MS4 to the MEP. The iterative approach is implemented through the annual reporting process with the review of the effectiveness of each MS4 Program Plan BMP. BMPs are modified, as necessary, to increase effectiveness. If new or modified authorities are identified as part of the annual measure of effectiveness as described for each BMP in the NOVA MS4 Program Plan annual reporting, they will be reported through the annual report process.

As a non-traditional MS4, NOVA does not have the ability to create legal authorities. No new policies and procedures or modifications to existing policies and procedures were identified as necessary to meet the requirements of the special conditions. Means and methods to meet the special conditions are described in Section 4.

3.0 POLLUTANT OF CONCERN LOADINGS

The 2013 – 2018 MS4 General Permit required NOVA to estimate the annual loadings and the POC load reductions 5.0% of the L2 Scoping Run reductions and 35% of L2. To complete these requirements, NOVA determined the amount of pervious and impervious land cover for their regulated campuses and input the data into the appropriate loading and reduction tables provided in the MS4 General Permit. The methodology to determine sediment and nutrient loadings and the required reductions are described in the following sub-sections.

3.1 Baseline Loading Characterization

Prior to estimating the POC loadings and required reductions, NOVA first evaluated the extent of their regulated MS4 area, including the regulated acres of urban pervious and impervious surface served by its MS4 as of June 30, 2009. These evaluations were conducted using Geographic Information System (GIS) digitization utilizing aerial photography, as depicted in Appendix A.

NOVA's MS4 regulated area was calculated using the NOVA property boundaries as a conservative estimate of the areas the MS4 serves. Campus boundaries were obtained from City of Alexandria, Fairfax County, Loudoun County, and Prince William County GIS data, for each respective regulated campus. The determination of regulated area was based on the 2010 CUA. Aerial photography was obtained from the 2009 Virginia Base Map Program Orthophotography Program Aerials¹. The extent of pervious, impervious and forest areas were digitized based on the aerial imagery using best professional judgment. For areas that were under construction or disturbed in the 2009 aerial imagery, current aerial images were used to determine whether the areas resulted in pervious or impervious surfaces after construction. A summary of baseline land cover results are provided in Table 2.

	-			
Land Cover	Alexandria	Annandale	Loudoun	Woodbridge
	Campus	Campus	Campus	Campus
Impervious	23.8	44.1	18.6	16.9
Pervious	12.6	16.5	65.9	16.2
Forest*	17.8	12.6	7.1	95.9
Surface Water*	0.0	2.6	1.5	4.7

Table 2: Classification of Campus Land Cover Area (Acres)

* Consistent with methodology described in the DEQ Guidance, these areas are not included in the loading computations described in Section 3.2.

3.2 5% Annual Loadings from Existing Sources

The data summarized in Table 2 was used to estimate pollutant loads from existing sources as of June 30, 2009, using the Potomac River Basin calculation sheet for estimating existing source loads provided in the MS4 General Permit. The calculation sheet was completed for each regulated NOVA campus as provided in Tables 3 - 6.

	Pervious	16.2	175.8	2,847.96	22,643.27

3.3 5% Annual Loadings from New Sources and Grandfathered Projects

In addition to computing baseline loadings from existing conditions as of June 30, 2009, the special conditions require the determination of offsets for increased loads from development occurring on or after July 1, 2009, including grandfathered projects. No offsets are necessary for new sources since:

- Loadings from new sources are addressed with the water quality criteria in the stormwater management regulations. Water quality criteria for new sources from regulated development between July 1, 2009, and June 30, 2014, was based on an average land cover condition of 16% and therefore appropriate offsets were incorporated within the development project's stormwater management plan.
- No NOVA projects are grandfathered.

3.4 Required 5% Load Reductions

The 2013 – 2018 MS4 General Permit required NOVA to reduce 5.0% of the L2 Scoping Run POC reductions for existing sources as of June 30, 2009. The required load reductions for all four campuses for this permit cycle were calculated using the calculation sheet in the MS4 General Permit for determining POC reductions for the Potomac River basin. The calculation sheets were modified with the corrected loading rates provided in DEQ's Guidance. The required load reductions for the Potomac Basin, reductions are not campus-specific and therefore summed in Table 11.

Pollutant	Regulated Urban Land Cover	Existing Acres Served by MS4 (06/30/09)	Reduction in Loading Rate (Ibs./acre)	Reduction Required First Permit Cycle (lbs.)	Total Reduction (lbs.)
Nitrogen	Impervious	23.3	0.07587	1.77	2.15

3.5 Required 35% Load Reductions

The 2013 – 2018 MS4 General Permit required NOVA to reduce 35.0% of the L2 Scoping Run POC reductions for existing sources as of June 30, 2009. The required load reductions for all four campuses for this permit cycle were calculated using the calculation sheet in the MS4 General Permit for determining POC reductions for the Potomac River basin. The required load reductions for each campus are depicted in Tables 12 - 15. Since each regulated campus is in the Potomac Basin, reductions are not campus-specific and therefore summed in Table 16.

Table 17: Compiled 40% Cumulative POC Reductions from all NOVA Regulated Campuse

3.7 Required 60% Load Reductions

The 2023 – 2028 MS4 General Permit will require NOVA to reduce 60.0% of the L2 Scoping Run POC reductions for existing sources as of June 30, 2009. The required load reductions for all four campuses for this permit cycle were calculated using the calculation sheet in the MS4 General Permit for determining POC reductions for the Potomac River basin. The required load reductions for each campus are depicted in Tables 18 - 21. Since each regulated campus is in the Potomac Basin, reductions are not campus-specific and therefore summed in Table 22.

- No expanded sources identified in the 2000 and 2010 expanded census urbanized area.
- No additional 60% reduction for new sources developed between 2009 and 2014 and for which the land use cover condition was greater than 16%.
- No modifications to the applicable loading rate provided to the operator as a result of TMDL modification.

3.8 Required Cumulative 100% Load Reductions

The required 100% cumulative load reductions for NOVA are depicted in Table 23.

Pollutant	Regulated Urban Land Cover	Existing Acres Served by MS4 (06/30/09)	Reduction in Loading Rate (Ibs./acre)	100% Reduction (lbs.)
Nitrogen	Impervious	103.40	0.07587	<u></u>
	Pervious	111.20	0.03021	223.33
Dhasaharus	Impervious	103.40	0.01296	20.09
Phosphorus	Pervious	111.20	0.00148625	29.98

Table 23: Compiled 100% Cumulative POC Reductions from all NOVA Regulated Campuses

4.0 MEANS TO ACHIEVE 5% POC REDUCTIONS

DEQ's Guidance was used to identify appropriate means and methods for achieving the required reductions computed in Section 3.4. A review of NOVA's existing stormwater management facilities determined that the required reductions were achieved for the 2013 - 2018 MS4 General Permit cycle as described in the following sub-sections.

Reduction credits described in this section demonstrate compliance with the reduction requirements for the 2013 - 2018 MS4 General Permit cycle with the understanding that any changes in established BMP efficiencies will not be retroactively applied to projects approved to meet reductions for the MS4 General Permit cycle.

4.1 5% POC Reductions Achieved from Existing BMPs

Consistent with the DEQ Guidance, certain credits from historic water quality BMPs can be credited towards pollutant load reductions requirements. Specifically, permittees can receive full credit from BMPs that were:

- Initially installed on or after January 1, 2006, and prior to July 1, 2009, and constructed to address water quality within the permittee's regulated service area; and
- Initially installed after June 30, 2009, if credit is only taken for reductions achieved more than the reductions required by the SWM regulations water quality criteria for the development.

A review of NOVA's water quality BMPs found one water quality BMP installed on or after January 1, 2006, and prior to July 1, 2009, described as follows:

 In April 2009, a bioretention facility, as described in the Virginia Stormwater Management Handbook, was installed on the Alexandria campus as part of a plan completed by EYP Architecture & Engineering, P.C., entitled "Northern Virginia Community College New Construction Phase III Renovation Phase I & II." Consistent with the stormwater regulations water quality criteria at the time, design computations for the bioretention demonstrate phosphorus reductions based on a 16% land cover condition. To quantify the amount of phosphorus, nitrogen and sediment being removed by the bioretention facility, water quality calculations were conducted based on the Chesapeake Bay Program Retrofit Equations. Computations are provided in Appendix B and summarized in Table 24.

Pollutant	Load Reduction Provided by BMP (lbs./yr.)
Nitrogen	7.49
Phosphorus	0.68
TSS	492.69

Table 24: Summary of 5% POC Reductions from the 2009 Bioretention BMP

A review of NOVA's water quality BMPs also identified four BMPs initially installed after June 30, 2009, that provide reductions more than the reductions required by the SWM regulations water quality criteria for the associated development. Each are described as follows:

• In June 2011, two bioretention filters, as described in the Virginia Stormwater Management Handbook, and a Filterra structure were installed on the Loudoun campus as part of a plan completed by EYP Architecture & Engineering, P.C., titled "Northern Virginia Community College Loudoun Phase III North Parking Lot." The plan indicated that pollutant removal requirements for the development were met and exceeded by 0.06 pounds of phosphorus per year. Calculations to determine the proportional nitrogen and sediment reductions achieved were computed based on the DEQ Guidance and are included in Appendix B and summarized in Table 25.

Pollutant	Load Reduction Required for Associated Development (lbs./yr.)	Load Reduction Provided (lbs./yr.)	Remaining Credit (lbs./yr.)
Nitrogen	N/A	21.61	0.39
Phosphorus	3.27	3.33	0.06
TSS	N/A	2,939	52.90

|--|

In July 2012, a retention basin III, as described in the Virginia Stormwater Management Handbook, was installed on the Loudoun campus as part of a plan completed by EYP Architecture & Engineering, P.C., entitled "Northern Virginia Community College Loudoun Phase III." Water quality compliance for the development was achieved utilizing the retention basin III BMP, referred to as "Pond 2" on the design plan, and two other existing BMPs installed prior to 2006. The design plan demonstrated that pollutant removal requirements were met and exceeded. To determine the amount of credit remaining in the retention basin III BMP, additional water quality calculations were performed and are included in Appendix B. The computations determined 1.88 pounds of phosphorus reduction per year is achieved more than what was required by the development. Calculations to determine the proportional nitrogen and sediment reductions achieved were computed based on DEQ's Guidance and are included in Appendix C and summarized in Table 26.

Pollutant	Load Reduction Required for Associated Development (lbs./yr.)	Load Reduction Provided (lbs./yr.)	Remaining Credit (Ibs./yr.)
Nitrogen	N/A	16.70	4.01
Phosphorus	5.99	7.87	1.88
TSS	N/A	3,406	817.53

The sum of the reductions summarized in Tables 20 and 21 exceeds the required POC reductions identified in Section 3.4. Therefore, the existing BMPs served as the means to meet the required reductions in accordance with the Chesapeake Bay TMDL special conditions for the 2013 – 2018 permit cycle. Required and provided reductions for NOVA are summarized in Table 27.

Pollutant	5% Reductions Required by L2 Scoping Run (Ibs./yr.)	Reductions Provided By 2009 Bioretention (Ibs./yr.)	Remaining Reductions Provided By 2011 Bioretentions/Filterra (Ibs./yr.)	Remaining Reductions Provided By 2012 Retention Basin III (lbs./yr.)	Total Reductions Provided by Existing BMPs (Ibs./yr.)
N	11.17	7.49	0.39	4.01	11.89
Р	1.50	0.68	0.06	1.88	2.62
TSS	1,290.82	492.69	52.90	817.53	1,363.12

Table 27: Summary of 5% POC Reductions from Existing BMPs

In summary, the existing BMPs exceeded the required 5% reductions.

4.2 Implementation of 5% POC Reductions to the MEP

Implementation of the 2013 – 2018 Action Plan was dependent on continued execution of the NOVA MS4 Program Plan. MS4 Program Plan BMPs was implemented per the schedules outlined in the NOVA MS4 Program Plan.

Since the 2013 – 2018 Action Plan was supported with existing stormwater BMPs, all actions were incorporated into the financially supported implementation of NOVA's MS4 Program Plan. Therefore, an estimate of expected costs was considered neutral.

4.3 Supplemental Means and Methods for 5% POC Reductions

In addition, the remaining Minimum Control Measure BMPs described in Section 2.1 were implemented by NOVA as part of the NOVA MS4 Program Plan. Continued implementation of these BMPs demonstrates implementation of the NOVA Chesapeake Bay Action Plan to the maximum extent practicable and demonstrates adequate progress.

4.4 Public Comment Period 5% POC Reductions

NOVA solicited public comments on the Plan and considered all comments that were provided for potential plan modifications. Public comment was provided through the following means:

- A draft of the Chesapeake Bay TMDL Action plan was posted on NOVA's website for a minimum of 7 total days.
- An email was sent to the target audience identified in Minimum Control Measure 1 of the NOVA MS4 Program Plan with a link where the public commented on the Plan.

4.5 Annual Reporting 5% POC Reductions

The effectiveness of the Action Plan was measured through the MS4 General Permit annual reporting requirement. NOVA reported annually on the implementation of the BMPs described in Section 4.1 of this Plan.

5.0 MEANS TO ACHIEVE 40% OVERALL POC REDUCTIONS

Prior to July 1, 2022, DEQ's Guidance Memo No. 15-2005 was used to identify appropriate means and methods for achieving the required reductions computed in Section 5.2. After July 1, 2022, DEQ's recent Guidance Memo No. 20-2003 was used to identify appropriate means and methods for achieving the required reductions computed in Section 5.3. The means and methods are described in the following sub-sections and is incorporated into the NOVA MS4 Program Plan for implementation.

POC load reductions described in the following sub-sections demonstrate compliance with the reduction requirements for the 2013 – 2018 and 2018 - 2023 MS4 General Permit cycles with the understanding that any changes in established BMP efficiencies will not be retroactively applied to projects approved to meet reductions for this MS4 General Permit cycle.

5.1 40% Overall POC Reductions Achieved with Existing BMPs

The existing BMPs described in Section 4.0 and summarized in Table 28 were used to partially satisfy the required 40% overall reduction.

Table 28: POC Reductions from Existing BMPs						
	5% Reductions					
Pollutant	Provided by Existing					
Pollutalit	BMPs					
	(lbs./yr.)					
Nitrogen	11.89					
Phosphorus	2.62					
TSS	1,363.12					

Table 28: POC Reductions from Existing BMPs

5.2 40% Overall POC Reductions Achieved with Street Sweeping Prior to July 1, 2022

Prior to July 1, 2022, NOVA implemented street sweeping to satisfy the required POC reductions. The "mass loading approach," as described in DEQ's Guidance Memo No. 15-2005, was used to determine the extent of street sweeping efforts to be implemented. Per the mass loading approach, the overall weight of material collected through street sweeping is multiplied by a dry weight factor and then a factor specific to each POC to quantify the pollutant reductions achieved. Given the target pollutant reductions and the dry weight and POC factors, it was determined that NOVA must collect a minimum of 44,252 pounds of material per year to meet the POC reduction requirements. Required reductions achieved through sweeping efforts prior to July 1, 2022, are summarized in Table 29.

Pollutant of Concern (POC)	40% Annual Reductions Required of L2 (Ibs./yr.)	Existing BMP Reduction Credit (Section 6.1)	Revised 40% Annual Reductions Required (lbs./yr.)	Dry Weight Factor	POC Multiplication Factor	40% Required Street Sweeping Material Weight (Ibs./yr.)
Nitrogen	89.33	11.89	77.44	0.7	0.0025	44,251.43
Phosphorus	11.99	2.62	9.37	0.7	0.001	13,385.71
TSS	10,326.52	1,363.12	8,963.40	0.7	0.3	42,682.86

Table 29: 40% Overall POC Reductions Achieved with Street Sweeping Prior to July 1, 2022

5.3 40% Overall POC Reductions Achieved with Street Sweeping After July 1, 2022

During the 2022 - 2023 reporting year, NOVA continued to implement street sweeping to partially satisfy the required POC reductions identified in Section 3.6 in accordance with DEQ's Guidance Memo No. 20-2003. The "revised street cleaning module," as described in the Guidance Memo was used to determine the extent of street sweeping efforts to be implemented. Table 1 within Appendix V.G – Street Cleaning Section of the Guidance Memo reflects the module's preferences to use regenerative air sweepers and sweeping frequency to increase nutrient sediment reduction rates. Nutrient and sediment reductions are provided for various street sweeping practices (SCP).

Using the standard street cleaning unit of one mile of curb miles swept on one-side and one acre equivalent for parking lots to one curb lane mile swept, NOVA has determined the number of total "curb lane miles" on their property. It was calculated that NOVA has <u>80.85 curb lane miles</u> on their MS4 properties. Using the nutrient and sediment loading rates for urban impervious cover for the Potomac River provided in the 2018 – 2023 MS4 General Permit (9VAC25-890-40), the required nutrient reductions were calculated. NOVA selected <u>SCP-3: 1 Pass Per 2 Weeks</u> to implement to partially meet the required nutrient and sediment reductions. Refer to Table 4 in Appendix B for the calculations.

5.4 40% Overall POC Reductions Achieved with Extra POC and Redevelopment Credits

In addition to street sweeping, NOVA selected several calculation methodologies from the DEQ Guidance Memo (GM) 20-2003 to quantify available nutrient credits. NOVA evaluated six structural BMPs built after 2009 for extra nutrient credits in accordance with Appendix V.A of the DEQ Guidance Memo. Refer to Table 2 in Appendix B for calculations. NOVA also evaluated four projects for redevelopment credits in accordance with Appendix V.E of the DEQ GM 20-2003. Refer to Table 3 in Appendix B for calculations.

5.5 40% Overall POC Reductions Achieved with Land Use Change Conversion

NVCC has implemented land use conversion to meet a portion of the 40% reduction requirements. Land use change involves converting a land cover from a higher pollutant loading classification to a lower pollutant loading classification to improve impacts on water quality. For example, impervious or turf areas can be converted to mixed open or forest. NOVA staff selected areas for land use conversion and DEQ GM 20-2003 Appendix V.H was used to calculate new nutrient reductions associated with the conversion. Calculations are included in Appendix B.

Table 30 summarizes the 40% POC reductions estimated to be achieved by NOVA annually based on the selected best management practices.

POC	BMPs Installed Prior to 7/1/2009 (lbs./yr.)	Reductions for BMPs Installed After 7/1/2009 (Ibs./yr.)	Redevelopment Reductions (Ibs./yr.)	Street Sweeping Reductions* (Ibs./yr.)	Land Use Change Conversion (Ibs./yr.)	Total 40% Reductions (lbs./yr.)
ΤN	11.89	43.20	9.52	27.26	3.80	95.67

Table 30: Summary of 40% Overall Planned POC Reductions

* Planned Street Sweeping reductions were not fully satisfied in the 2022 – 2023 reporting year. Therefore, additional BMPs have been added such as Storm Drain Cleaning. See Appendix B.

5.6 Implementation of 40% POC Reductions to the MEP

Implementation of the 2018 – 2023 Action Plan was dependent on continued execution of the NOVA MS4 Program Plan. MS4 Program Plan BMPs were implemented per the schedules outlined in the NOVA 2018 – 2023 MS4 Program Plans.

5.7 Supplemental Means and Methods for 40% POC Reductions

In addition, the remaining Minimum Control Measure BMPs described in Section 2.1 were implemented by NOVA as part of the NOVA MS4 Program Plan. Continued implementation of these BMPs demonstrates implementation of the NOVA Chesapeake Bay Action Plan to the maximum extent practicable and demonstrates adequate progress.

5.8 Public Comment Period 40% POC Reductions

NOVA solicited public comments on the Plan and considered all comments that were provided for potential plan modifications. Public comment was provided through the following means:

- A draft of the Chesapeake Bay TMDL Action plan was posted on NOVA's website for a minimum of 15 total days.
- An email was sent to the target audience identified in Minimum Control Measure 1 of the NOVA MS4 Program Plan with a link where the public commented on the Plan.

5.9 Annual Reporting 40% POC Reductions

The effectiveness of the Action Plan was measured through the MS4 General Permit annual reporting requirement. NOVA reported annually on the implementation of the BMPs described in Sections 4.0 and 5.0 of this Plan.

6.0 MEANS TO ACHEIVE 100% CUMULATIVE POC REDUCTIONS

Implementation of the Phase III Action Plan will be dependent on continued execution of the NOVA MS4 Program Plan and implementation of new BMPs to meet the required additional 60% or cumulative 100% reductions. Table 31 summarizes the additional 60% reductions to be achieved for this permit cycle. A list of BMPs that will be evaluated is provided in Table 32.

Table 31: Summary of POC Required Reductions

РОС	Cumulative 100% Required Reduction (lbs./yr.)	Required Additional 60% Reduction to be Achieved (lbs./yr.)
ΤN	223.33	134.00
TP	29.98	17.99

1. Street Sweeping
2. Land Use Change Conversion
3. Nutrient Credit Purchase
4. Stormwater Facility Conversion
5. New Clearinghouse Stormwater Facility
6. Redevelopment

NOVA has implemented Step 1 with this draft Phase III Action Plan and will continue the implementation strategy described in this Section during the 2023 - 2028 MS4 General Permit cycle. Implementation will demonstrate adequate progress and be documented with the implementation of the remaining steps in the schedule and measurable goals described in Table 33.

Table 33: Schedule for an Additional 60% POC Required Reductions

Step	General Description	Measurable Goal	Completion Date
1	Identify BMPs to evaluate. (See Table 26)	Submit a draft Phase III Chesapeake Bay TMDL Action Plan with BMPs identified to be evaluated in the 2023 – 2028 permit cycle.	October 2023
2	Perform calculations and evaluate most beneficial BMPs to implement	Submit a Phase III Chesapeake Bay TMDL Action Plans within 12 months as required by the 2023 – 2028 MS4 General Permit with BMPS to be implemented within the permit cycle including soliciting public comment.	November 2024
3	Implement BMPs over time as funds are available.	Annually report on progress. Revise Action Plan, if necessary.	July 2025

4	Implement BMPs over time as funds are available.	Annually report on progress. Revise Action Plan, if necessary.	July 2026
5	Implement BMPs over time as funds are available.	Annually report on progress. Revise Action Plan, if necessary.	July 2027
6	Achieve additional 60% reductions by selected BMPs.	Annually report on progress. Revise Action Plan, if necessary.	July 2028
7	Report on Chesapeake Bay TMDL 60% reduction achievement.	Record results in Annual Report.	October 2028

6.1 Supplemental Means and Methods for 100% Cumulative POC Required Reductions

In addition, the remaining Minimum Control Measure BMPs described in Section 2.1 will be implemented by NOVA as part of the NOVA MS4 Program Plan. Continued implementation of these BMPs demonstrates implementation of the NOVA Chesapeake Bay Action Plan to the maximum extent practicable and demonstrates adequate progress.

6.2 Public Comment Period for 100% Cumulative POC Required Reductions

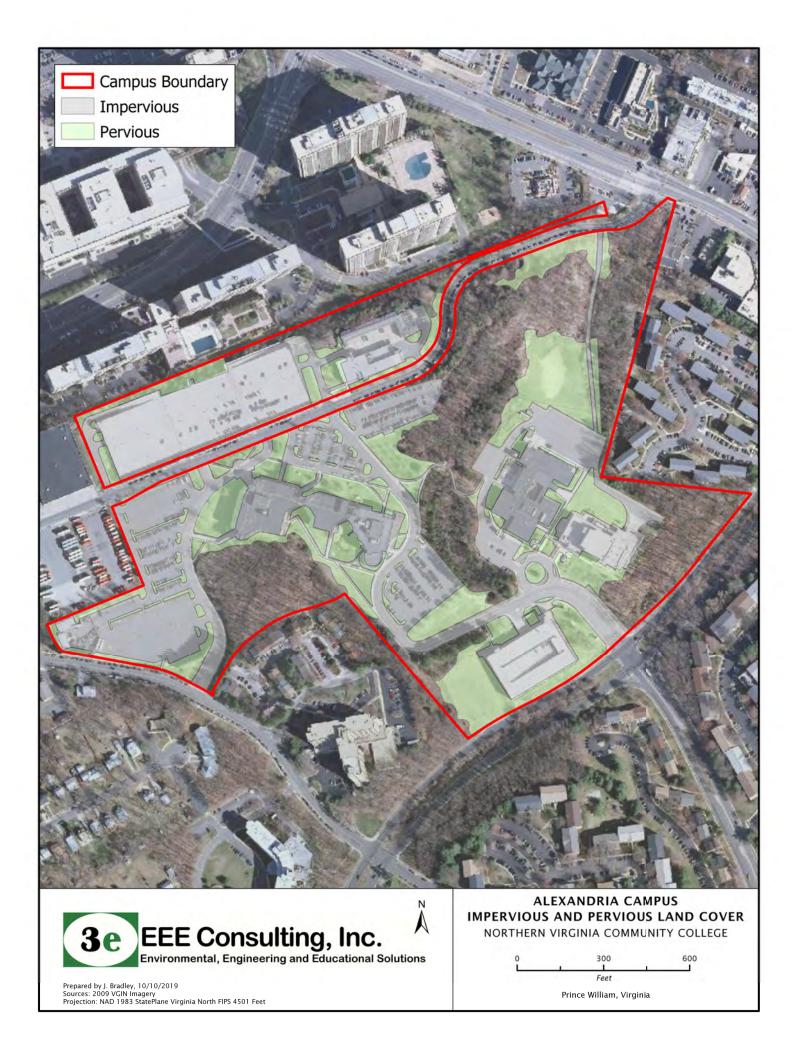

NOVA will solicit public comments on the Plan and consider all comments that are provided for potential plan modifications. Public comment will be provided through the following means:

- A draft of the Chesapeake Bay TMDL Action plan will be posted on NOVA's website for a minimum of 15 total days.
- An email will be sent to the target audience identified in Minimum Control Measure 1 of the NOVA MS4 Program Plan with a link where the public may comment on the Action Plan.

6.3 Annual Reporting for 100% Cumulative POC Required Reductions

The effectiveness of the Action Plan will be measured through the Chesapeake Bay annual reporting requirement as described in the 2023 – 2028 MS4 General Permit. NOVA will report annually on the implementation of the BMPs described in Section 7.0 of this Plan.
