Your nutrient management plan (NMP) dated 7/15/2021 for Northern Virginia Community College Medical Education Campus located in Fairfax County has been approved by the Virginia Department of Conservation and Recreation (DCR). The approved plan is for 1.5 acres.

This site has not been inspected by DCR and this approval is contingent upon field conditions being as stated in the NMP. Any revisions to this plan must be approved by DCR. Please note that this letter should be kept with the NMP and supporting documentation including nutrient application records. This plan expires on 7/15/2024. Please feel free to contact me with any questions or concerns regarding this approval.

Best regards,

Anita Tuttle

1.0 INTRODUCTION AND SITE DESCRIPTION

1.1 Introduction

This Nutrient Management Plan (NMP) is for the Springfield Medical Education Campus (MEC) of the Northern Virginia Community College (NOVA) located east of I-95 near Springfield, in Fairfax County, Virginia (Figure 1).

This NMP addresses only the nutrient management of turfgrass. Management of other vegetated areas containing trees, flowering ornamentals, small shrubs and groundcovers, is performed by each facility and their landscape contractor based on very site-specific conditions including but not limited to the type and status of vegetated areas, annual soil testing, and the occurrence of pests and weeds. This NMP is effective for three years until July 15, 2024 or until major renovation or other changes to maintenance practices occur. This NMP should be used as a resource for planning the quantity and timing of turfgrass nutrient application based on sound agronomic practices.

1.2 Site Description

The 5.9-acre Medical Education Campus contains a large turfgrass area in the front of the building, facing Springfield Center Drive. There are also turf areas around the sides of the building and along the parking garage and entrance drive. All turf areas have been seeded with a tall fescue blend (mix of fine leaved tall fescue and Kentucky bluegrass) and are therefore categorized as cool season turf.

In general, turf conditions are very good. Most turf west of the garage (HG) is irrigated. The remaining turf to the north and northeast is not irrigated.

A few environmentally sensitive areas are located at the Woodbridge Campus. One sand filter is located north of the garage (HG) and another sand filter is located southwest of the main building (HE), a filterra, and a jellyfish structure are located in the parking lot in the northeast corner of the site as shown on Figure 2. Section 4 addresses environmentally sensitive areas.

1.3 Current and Future Turf Maintenance

All turf maintenance is performed by NOVA's landscaping contractor including mowing, herbicide, fertilizer and lime applications, as well as aeration and overseeding.

A landscaping maintenance contractor will be performing most turf management including all nutrient applications. It will be the responsibility of the Landscape Supervisor and the campus Facility Manager to ensure the nutrient management plan is followed.

2.0 SOIL SAMPLING AND ANALYSIS

Most of the soils in the turf areas have been heavily modified and are considered Urban Land in the U.S. Department of Agriculture (USDA) soil survey. Soils generally consist of a sandy loam texture.

A soil sample was collected on March 18, 2021 from the turfgrass at the MEC Campus and submitted for laboratory analysis including pH, buffer pH, phosphorus and potassium, and other soil properties. Figure 2 shows the soil sampling area and Table 1 presents the laboratory results. Appendix A presents the soil laboratory data. No sampling was performed within wooded or landscaped areas.

Soil laboratory results were converted into nutrient management ratings based on the Virginia Nutrient Management Standards and Criteria (VNMS&C). The soil phosphorous level rated L, and the potassium concentration rated M. Soil pH was above the target level of 6.2, at 6.7 Standard Units (SU). The soil laboratory report is presented in Appendix A.

3.0 NUTRIENT MANAGEMENT AREAS

The entire 1.50-acres of turf at the Medical Education Campus is in one Nutrient Management Area. Figure 3 shows the nutrient management area. Table 2 presents the application schedule for the nutrient management, discussed in greater detail in Section 3.1 below.

3.1 Nutrient and Liming Applications

3.1.1 Nitrogen, Phosphorous and Potassium

Nitrogen, phosphorous (P2O5) and potassium (K2O) are the three macronutrients essential for healthy turf and, along with lime applications, are the central focus of the NMP. Phosphorous and potassium recommendations are based on the soil laboratory results. Nitrogen recommendations are based on the turfgrass needs, not soil test results, which vary based on the type of turfgrass (cool vs. warm season) and level of management (standard vs. intensive). Recommended rates and timing of all three macronutrients is based on the VNMS&C.

The acceptable window for nitrogen application for cool season fescue turf at the Medical Education Campus is six weeks prior to the last spring average frost and six weeks after the first fall average frost from February 27 until December 6. Although aggressive spring and summer nitrogen fertilization can result in lush, dark green foliage, this occurs at the expense of the turf's root system. Turf with an inadequate root system will then struggle in the summer heat and moisture conditions. Additionally, too much nitrogen in spring and summer for cool season turf can result in leaching or runoff to nearby waterbodies. For these reasons, only 0.5 pound of slow-release nitrogen is recommended during May to June to provide a sustained growth response

in monthly increments from September through November.

As phosphorous and potassium are not as mobile as nitrogen and generally reside in soil for longer periods of time, the application timing of these two macronutrients is not as critical as nitrogen. Incremental applications of these nutrients from September to November are recommended.

3.1.2 Lime and pH

Soil acidity is critical to plants because it affects the availability of nutrients in the soil and potential leaching of nutrients from the soil. Cool season fescue prefers a soil pH that is slightly acidic, at a level of approximately 6.2 Standard Units (SU). Periodic lime applications are necessary for many Virginia soils to correct low pH, add buffering capacity, to provide secondary nutrients calcium and magnesium as well as some micronutrients. Liming rates are based on soil test pH and buffer indices. Based on the 2021 soil samples, no lime applications are recommended for the first year of this NMP (see Table 2). Liming recommendations are for the first year following soil sampling only. The soil should be tested for soil pH and Buffer pH in the late fall to winter each year to determine if additional annual liming is necessary.

3.2 Selection of Fertilizers

Specific fertilizers and herbicides have not been selected as a part of this NMP in order to provide greater flexibility and cost savings. The landscape contractor has the option to select either commonly used fertilizer blends that they may already have in stock or are readily available, or they can use custom blends, a common practice in the commercial landscaping industry. Slow-release nitrogen containing fertilizers are recommended. This NMP will require revision should the landscape contractor and the campus Facility Manager decide to use animal manures or Class B biosolids (not of exceptional quality).

Provided that the maximum rate of nitrogen per application and the total annual rates of all three nutrients are not exceeded as detailed in Table 2, the landscape contractor may use their discretion with the exact ratio of nutrients applied per application.

3.3 Pre- and Post-Emergent Herbicides

Weed control is a necessary requirement for healthy turf and has been implemented in the past at the Medical Education Campus. In the previous NMP period, pre and post emergent herbicides containing nitrogen fertilizers were applied in spring and early summer months for the campus grounds. As presented in Section 3.1.1, only one application of slow-release nitrogen is recommended in the late spring. Therefore, additional straight application of herbicides without nitrogen additives may be required.

3.4 Precautions for Fertilizer Applications

General precautions for fertilizer application include:

- Try to avoid applying fertilizers on steep slopes 48-hours prior to a rain event.
- Do not apply fertilizers to frozen or snow-covered ground, nor should they ever be used as ice melt.
- Avoid/minimize application of fertilizers to impervious areas such as parking lots, roads, and sidewalks, and within 25 feet of environmentally sensitive areas and stormwater collection/management facilities.
- Remove any granular materials that land on impervious surfaces by sweeping and collecting, and either put the collected material back in the bag or spread it onto the turf.

4.0 ENVIRONMENTALLY SENSITIVE AREAS AND RECOMMENDED BUFFERS

Two underground sand filters, a filterra, and a jellyfish structure are located on the Campus. These stormwater management facilities are identified on Figures 2 and 3.

5.0 OTHER TURF MANAGEMENT CONSIDERATIONS

Aeration - Extensive core cultivation/aeration in the late summer to early fall is recommended for the Medical Education campus. Core aeration is very disruptive to surface smoothness, but it is the best way to relieve the physical effects of soil compaction and increase soil oxygen levels.

Grass Seed Type – Refer to the most recent Virginia Cooperative Extension's *Virginia Turfgrass Variety Recommendations* found online at https://www.sites.ext.vt.edu/newsletter-archive/turfgrass/index.html when selecting seed mix for over-seeding. The type should be suitable to environmental conditions of the Northern Virginia Transition zone. A general recommendation for the Medical Education Campus is 90% Tall Fescue possibly blended with 10% Kentucky Bluegrass for turf in primarily sunny locations. Fine fescue blends may be more appropriate for shadier turf areas.

Iron - Iron applications (particularly foliar applications) may periodically be used for enhanced greening as an alternative to nitrogen. These applications are most beneficial if applied in late spring through summer for cool season grasses and in late summer/fall applications for warmseason grasses. Since iron is a micronutrient, its application levels are very low. The color response is short-lived (typically two to three weeks) because the iron-induced color response in the leaves is removed by mowing.

Management of Grass Clippings - The recycling of grass clippings on turf should be encouraged as an effective means of recycling nitrogen, phosphorus, and potassium. Where aesthetics allow, all clippings from mowing events should be returned to the turf rather than discharging them onto sidewalks or streets. Clippings should not be blown onto impervious surfaces or surface waters, dumped down stormwater drains, or piled outside where rainwater will leach out the nutrients creating the potential for nutrient loss to the environment.

Spreader Equipment Calibration - Spreader equipment calibration is critical to NMP implementation. The landscape contractor should supply equipment calibration records to the campus Facility Manager on a routine basis.

6.0 RECORDKEEPING

Proper NMP implementation requires diligent record keeping of fertilizer, lime and herbicide applications, and turfgrass conditions. Important information to retain with the plan includes soil tests reports; spreader settings; calibration results, dates of fertilizer application and rates applied; seeding or renovation; and unusual stresses caused by disease, drought, and pests. This information will also provide the background needed for future plan revisions. NMP Application record keeping forms are included in Appendix B for use for tracking fertilizer, lime, pesticide and herbicides.

204154 754	Sept 1	Aerate, Overseed & Fertilize	50% or greater	0.9	0.5	0.25	
2.8*-1.5*75*	Oct 1	Fertilize	50% or greater	0.9	0.5	0.25	
	Nov 1	Fertilize	50% or greater	0.5	0.5	0.25	
	Totals:			2.8	1.5	.75	

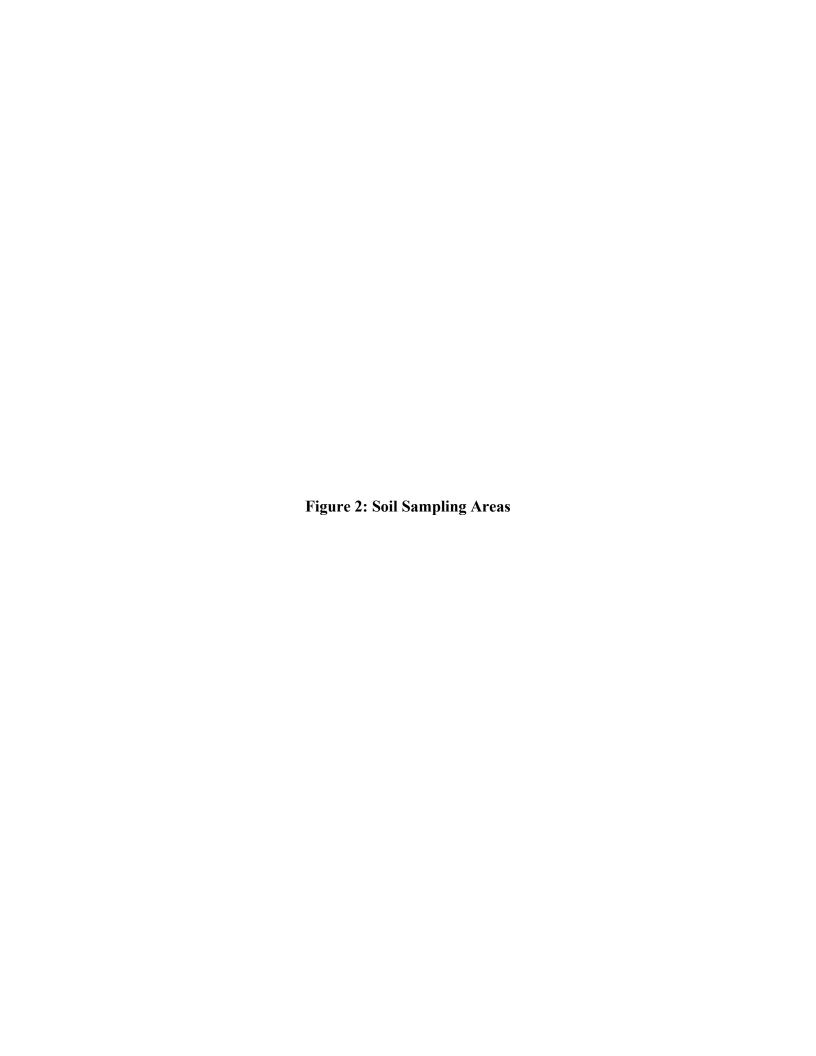

Notes:

- *Up to 3.5 lbs. of nitrogen, 2.5 lbs. of phosphorous, and 1.5 lbs. of potassium per 1000 ft² is allowed for this NMA per the VNMS&C, but the amount of these nutrients recommended in this plan is reduced due to the good condition of turfgrass at the Campus.
- 1. Fertilizer recommendations are flexible if the following conditions are met: a) no more than 0.7 pounds of Water Soluble N per 1000 ft² is applied within a 30-day period; b) no more than 0.9 pounds of Total N (per 1000 ft²) may be applied within a 30-day period; c) no more than 0.5 pounds of N per 1000 ft² is applied for the April 15-May 15 and the November applications; and d) Total annual fertilizer amounts for each nutrient should not exceed the Annual Nutrient Needs listed in column 1.
- 2. The month and day designations are a general guideline. Apply as close to the month as possible, using the day designation to determine the interval between applications.
- 3. Based on the soil sample laboratory results, no lime applications are needed for the first year of this NMP. Liming for successive years should be based on additional soil pH and buffer pH testing.
- 4. Do not apply inorganic fertilizers on frozen or snow-covered ground, or on denuded areas. Any fertilizer that makes its way onto impervious surfaces should be swept or blown back into pervious turfgrass covered areas. Do not use fertilizers as ice melt.
- 5. Use a drop spreader for application of inorganic fertilizers on turf areas less than 10 feet wide or on slopes greater than 2%.
- 6. Apply pre and or post emergent herbicides as needed, but do not use fertilizer containing herbicide prior to April 15. Conditions must be met in Note 1.
